

iGEM, the **International Genetically Engineered Machine** program, is the premier undergraduate Synthetic Biology event. In 2010, 130 student teams from schools in Asia, Europe, Latin America, Canada, and the US are designing and building simple biological systems from standard, interchangeable parts. These students present their designs and systems at the Championship Jamboree at MIT.

The accomplishments of these student teams during one summer are impressive and will lead to important advances in medicine, energy, and the environment.

## Sponsorship Benefits:
